CSA1522-Cloud computing and big data analytics
Experiment-10

Aim: Create a simple cloud software application to run a c program to display the student information using any Cloud Service Provider to demonstrate SaaS with the template of student name, reg no, address, phone, age, courses, grades and attendance report, progress report, Semester mark sheet forms.

Procedure:

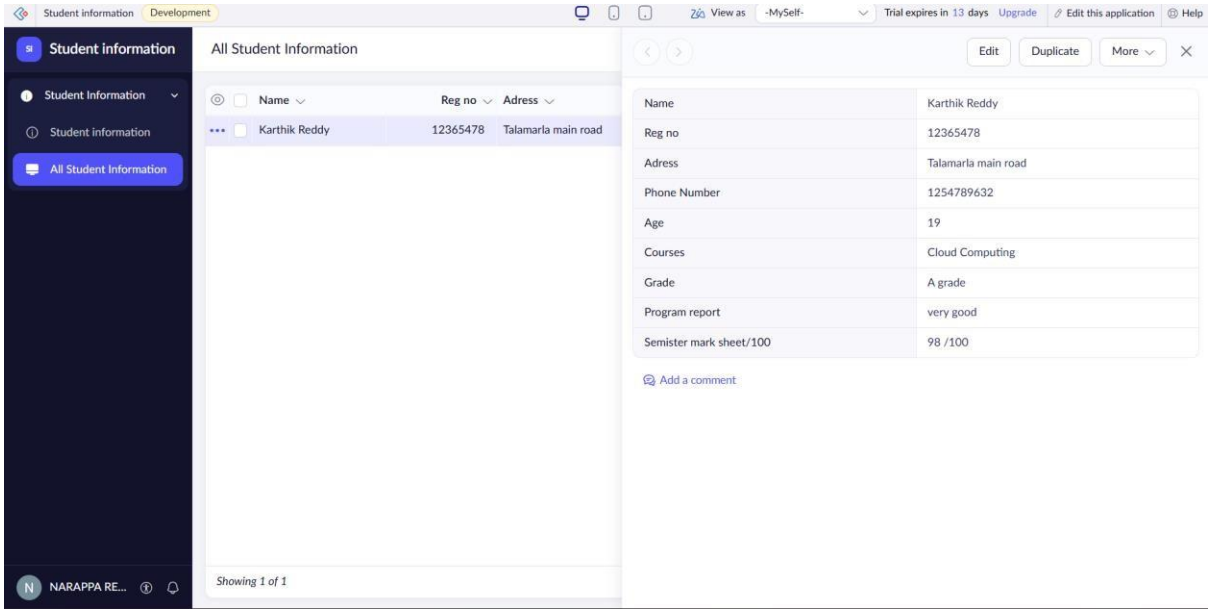

1. Select a cloud service provider or cloud-based C compiler such as OnlineGDB to demonstrate the SaaS model.
2. Open the cloud C compiler using a web browser and select C as the programming language.
3. Create a new C program for the Student Information System.
4. Define variables or a struct for student name, register number, address, phone number, age and courses.
5. Add variables to store grades, subject marks and attendance percentage.
6. Write the C program using scanf() to accept student details and printf() to display them.
7. Add calculations for the total marks, average marks and overall performance.
8. Include output sections for the Attendance Report, Progress Report and Semester Mark Sheet.
9. Compile and execute the C program on the cloud platform and verify the displayed student information.
10. Observe that the application is accessed through the browser without managing the underlying infrastructure, thereby demonstrating SaaS in Cloud Computing.

Input:

Output:

Name	Reg no	Adress	Phone Number	Age	Courses	Grade
Karthik Reddy	12365478	Talamarla main road	1254789632	19	Cloud Computing	A grade

Result:

Thus, the Student Information System was successfully created and executed on a cloud platform using C. The student details, grades, attendance report, progress report and semester mark sheet were displayed successfully, demonstrating the SaaS model of Cloud Computing.
